Shopify builds: 8vsze4-uu.myshopify.com | divinehindu.in | shapify.in | pujaghar.store | Bundle builder: divinehindu.in/pages/byob

SUMMARY

Shopify developer with 5 years of software engineering experience, the last two building and redesigning complete storefronts for direct-to-consumer brands. I build themes by hand from an empty directory in Liquid, HTML, CSS and JavaScript rather than configuring a bought theme, so the result matches the design instead of approximating it. I have taken a store through a full redesign with redirect mapping, a staged cutover and post-launch monitoring, and delivered client storefronts end to end as the direct client contact. My work is built to be handed over: Online Store 2.0 sections with named settings and product content in metafields, so the client changes copy, images and offers without a developer. I build outside the US and Europe, so multi-currency, local payment methods and market-specific checkout are normal parts of a build for me.

TECHNICAL SKILLS

Shopify: Liquid, theme development from an empty directory, theme customisation, Online Store 2.0 sections and blocks, section schemas, JSON templates, scalable product and collection templates, metafields and metaobjects, filters, search and related-product sections, cart and cart drawers, AJAX Cart API, Section Rendering API, Theme App Extensions, Shopify CLI, Admin and Storefront APIs, Shopify Plus, Markets

Frontend and UI: HTML, CSS, vanilla JavaScript (ES6+), responsive development for desktop, tablet and mobile, mobile-first implementation, pixel-accurate implementation from Figma and design references, cross-browser and real-device testing

Commerce and Integrations: Multi-currency and multi-market setup through Shopify Markets, shipping and checkout configuration, payment gateway integration, third-party one-click checkout, cash-on-delivery verification, third-party app setup and troubleshooting (reviews, email, chat including WhatsApp click-to-chat, analytics)

Conversion, Speed and SEO: High-converting landing and product pages, cart and post-add-to-cart upsells, bundle builders with live repricing, A/B test variants, Core Web Vitals and Lighthouse optimisation, structured data, titles and meta descriptions, sitemap and Search Console, GA4 and Google Tag Manager

Wider Stack and Process: TypeScript, React, Next.js, Node.js, Prisma, PostgreSQL; Git and GitHub with pull-request review, duplicate and staging themes, release checklists, self-QC before handoff, post-launch support

EXPERIENCE

Senior Shopify Developer (Full-Stack)

Divine Hindu | Remote | January 2025 to Present

- Sole engineer and technical owner for a direct-to-consumer Shopify business and for client stores: complete builds and redesigns, from discovery and estimate through build, QA, launch and live support.
- Built the storefront from an empty theme directory: own Liquid architecture, Online Store 2.0 section and block schema, metafield content models, and hand-written CSS and JavaScript so each page ships only what it needs. Later ran a full redesign with redirect mapping, a staged cutover and post-launch funnel monitoring.
- Build every page type: homepage, collection and shop pages with filters, search and related products, product pages on a scalable template driven by metafields, cart and cart drawer, and content pages, all mobile-first and tested on real devices.
- Build conversion features into the theme rather than installing apps for them: a build-your-own bundle page with live repricing through the Cart and Section Rendering APIs, cart and post-add-to-cart upsells, promotional pricing and A/B variants, keeping the site fast and app costs down.
- Configure commerce for a non-US market: multi-currency and market setup through Shopify Markets, shipping and checkout configuration, payment gateway integration, and a third-party one-click checkout with cash-on-delivery verification, reconciled against Shopify's own order and refund records.
- Own site speed, Core Web Vitals and SEO: modern image formats, lazy loading below the fold, the largest above-fold image preloaded, non-critical JavaScript deferred, app-stack audits to cut script weight, structured data, meta titles and descriptions, sitemap and Search Console.
- Hand over stores non-technical owners can run: sections named plainly in the theme editor, product content in metafields, plus a walkthrough, written guide and staff training.

Software Engineer (React, TypeScript)

TIAA Global Capabilities Private Limited | India | July 2021 to January 2026

- Built React and TypeScript front ends, backend services and integrations for business applications across a global financial services enterprise, under formal code review, change control and incident management, working daily with teams in the United States.

SELECTED SHOPIFY BUILDS

Premium minimal fashion storefront | Liquid, Online Store 2.0, HTML, CSS, JavaScript

- Editorial storefront built from an empty theme directory, no bought theme and no page builder: restrained typography, full-bleed imagery, a drop and capsule merchandising system, journal and bestsellers sections, and an announcement bar carrying shipping, returns and promotional messaging. Every section is configurable in the theme editor so merchandising can change the homepage per drop without a developer. The closest thing in my portfolio to a premium international brand look. Live at 8vsze4-uu.myshopify.com.

Divine Hindu: from-scratch build and full redesign | Liquid, metafields, Cart API, Section Rendering API

- Complete storefront: a scalable product template driven by metafields so a new product needs content entry rather than code, collection and shop pages with filters and search, related-product sections, cart and cart drawer, and a build-your-own bundle page where customers pick items and the total reprises live with tiered quantity discounts. Later taken through a full redesign with redirect mapping, a staged cutover and post-launch funnel monitoring, with no loss of traffic through the change. Live at divinehindu.in and divinehindu.in/pages/byob.

Client storefronts: shapify.in, pujaghar.store | Shopify, Liquid, client delivery

- Owned both as the direct client contact from first conversation to launch: requirements and a written estimate, theme build to the agreed design, collection and product setup, third-party app and tracking configuration, staging QA across browsers and real devices, launch, staff training, and post-launch support, delivered to the agreed scope and timeline. Both owners run their own stores day to day without coming back to me for content changes.

ReviewMaster: public Shopify app through App Store review | TypeScript, Node.js, GraphQL Admin API

- Multi-tenant reviews platform with a Theme App Extension so merchants place the review display anywhere in their theme from the editor: OAuth install with minimal scopes, GraphQL Admin API, webhook-driven sync, and an embedded admin. Built and shipped through Shopify's App Store review on security, performance and merchant experience. Relevant here because reviews are on your requirement list and I know what a good review implementation costs a page in load time.

HOW I WORK

- I read the design first and ask about the cases it does not cover, on mobile especially, before I write anything. A design that works at 1440 and falls apart at 375 is the most common reason a build comes back for rework.
- I build on a duplicate theme, QC my own work on real devices and in staging, and hand over through a checklist rather than a message saying it is done.
- I recommend a native Shopify feature or an established app over a custom build where it genuinely fits, and say so plainly, because the cheapest line of code is the one nobody has to maintain.

EDUCATION AND CERTIFICATIONS

Bachelor of Technology (B.Tech), Information Technology, Symbiosis Institute of Technology, Pune, India. 2017 to 2021. **Microsoft Certified:** Azure Fundamentals (AZ-900); Power Platform Fundamentals (PL-900).
